Convergence comparison — independent runs
Validation PSNR (dB) (higher is better)
Validation SSIM (higher is better)
Validation LPIPS (lower is better)

epoch
epoch
epoch
Independent training runs, not a paired trajectory: identical seed and configuration, but different architectures consume the RNG stream differently.
Run-to-run variance is UNMEASURED, so a gap between curves at one epoch is not a controlled measurement of the module's effect.
Quantitative comparison: paired per-image test-set statistics, not this figure.
